

FinTrack Pro Documentation

Architecture: vanilla HTML, CSS, and JavaScript with Local Storage persistence.

Core screens: landing, login, register, dashboard, and settings.

Data flow: transactions are normalized to USD, then rendered in the selected currency.

Exchange rates are fetched from a public API and cached locally for resilience.

Usage: register, log in, add transactions, filter rows, switch currency, and manage theme.

Development sequence: storage, auth, dashboard, settings, currency conversion, styling, docs.
